Testicular Cancer
What you should know
What is testicular cancer?

Testicular cancer is when the normal cells in your testicle grow in an abnormal way to form a lump called a tumour.

The testicles are two small, egg-shaped organs which hang below your penis in a pouch of skin called the scrotum. The testicles make sperm and also the hormone testosterone, which is responsible for male qualities like a deep voice, facial hair and strong muscles. Testosterone also controls your sex drive and erections.
What can increase my risk of testicular cancer?

The most common risk factors for testicular cancer include:

- **An undescended testicle**
  
  Testicular cancer is more common in men who were born with a testicle that did not come down into the scrotum.

- **A previous history of testicular cancer**
  
  If you had testicular cancer before, it slightly increases your risk.

- **Family history**
  
  If your brother or father had the disease, the risk is higher.

- **Fertility problems**
  
  If you have fertility problems, the risk is slightly increased.

- **Ethnic group**
  
  White men have a higher chance of getting the disease than Afro-Caribbean or Asian men.

Risk factors increase your chance of getting testicular cancer. Having a risk factor doesn’t mean you will get testicular cancer. Sometimes people with no risk factors may get the disease.

How can I reduce my risk of testicular cancer?

**Check yourself**: You are more likely to survive cancer if you spot it at an early stage. Learn what feels normal for you and check your testicles every month. Visit your doctor if you notice anything unusual. For example, pain, a swelling, lump or anything that feels different.
What are the symptoms of testicular cancer?

- A painless lump or swelling in a testicle
- Pain, discomfort or heaviness in your testicle or scrotum
- Pain or a dull ache in your groin or tummy.

Less common symptoms:

- A dull ache in your back
- Tenderness in your breast
- Stomach ache
- Shortness of breath
- A painless lump in the side of your neck.

Always get any change that is unusual for you checked by a GP (family doctor). Even if you have pain or swelling after an injury, for example after playing a direct contact sport, it is still a good idea to get it checked out.

These symptoms can be caused by other things, but always get them checked out.

If you are diagnosed with cancer, our booklet has more information.
What should I do if I have any symptoms?

If you have any symptoms or changes in your body that you are worried about, it’s important to have them checked by your GP (family doctor). The chances are it will not be cancer. Getting your symptoms checked is not wasting anyone’s time. The sooner cancer is spotted, the more likely you are to recover from it.

How is testicular cancer diagnosed?

If your GP thinks your symptoms need to be looked at, you will have more tests. Tests that can help to diagnose testicular cancer include:

- **Ultrasound scan:** A scan that looks at the tissues in your scrotum. It can show if there is a lump in your testicle.

- **Blood tests:** Blood tests can spot ‘tumour markers’ - chemicals that are released by some testicular cancers into the bloodstream.

- **Removing the testicle:** The only way your doctor can confirm if the lump or swelling is cancer is by removing the testicle. The cells can then be examined under a microscope.
How can I check myself?

The best time to examine yourself is after a warm bath or shower when the skin of your scrotum is relaxed.

1. Hold your scrotum in your hands
2. Use the fingers and thumbs of both hands to examine your testicles
3. Gently feel each testicle, one at a time, for any change in size or weight
4. One testicle is often slightly larger or hangs lower than the other
5. Your testicle should be smooth, with no lumps or swellings
6. It is normal to feel a soft tube at the top and back of the testicle. This is the sperm collecting tube known as the epididymis.

Can I be screened for testicular cancer?

Testing for cancer when you have no symptoms is called screening. There is no testicular cancer screening programme in Ireland at present. If you are worried or feel you may be at risk, talk to your GP.
12 ways to reduce your cancer risk

- Do not smoke
- Avoid second-hand smoke
- Be a healthy weight
- Be physically active in everyday life
- Have a healthy diet
- Avoid alcohol

Based on the European Code Against Cancer
Avoid too much sun
Avoid pollutants
Get screened for cancer
Breastfeed your baby/Limit HRT
Get vaccinations - Hepatitis B for babies/HPV for girls
Find out if you are exposed to radon gas in your area
Some facts about testicular cancer

15-34
Testicular cancer is rare, but it is the most common cancer in young men aged 15–34 in Ireland

Testicular cancer can be easily treated and usually curable

Usually the testicle is removed if cancer is suspected, but this shouldn’t affect your fertility or sex life

How common is testicular cancer?

Testicular cancer is not common. Around 170 men in Ireland are diagnosed each year.
More information:

If you are worried or have questions about testicular cancer or any cancer:

Call our Cancer Nurseline
Freephone 1800 200 700
or email cancernurseline@irishcancer.ie for confidential advice, support and information.

Visit our Daffodil Centres where our nurses can give you advice about healthy lifestyles and how you can reduce your risk of cancer. To find out where your local Daffodil Centre is, email daffodilcentreinfo@irishcancer.ie

Visit our website www.cancer.ie for more information on testicular cancer and ways you can reduce your risk of cancer.

Want to stop smoking?

Quitting smoking is one of the best things you can do to reduce your risk of cancer.

If you would like advice or support on quitting, call the HSE Quit Team on CallSave 1800 201 203, Freetext QUIT to 50100 or visit www.quit.ie
