Understanding Cancer of the Ovary

Caring for people with cancer
This booklet has been written to help you understand more about cancer of the ovary. It has been prepared and checked by cancer doctors, other relevant specialists, nurses and patients. The information in this booklet is an agreed view on this cancer, its diagnosis and treatment and the key aspects of living with it.

If you are a patient, your doctor or nurse may wish to go through the booklet with you and mark sections that are important for you. You can also make a note below of the contact names and information you may need.

Understanding cancer of the ovary

Introduction

This booklet has been written to help you learn more about cancer of the ovary. This is also called ovarian cancer. The booklet describes what it is and how it is diagnosed and treated. We hope it answers some of your questions and encourages you to discuss them with your doctor and nurse too.

We cannot advise you about which treatment to choose. You can only make this decision, along with your doctor, when all your test results are ready. But we can help you learn more about some of the methods used to treat this cancer and the side-effects that may occur when treatment is given.

This booklet also discusses some of the feelings you and those close to you may have when a diagnosis of cancer is made. At the end of the booklet you will find a list of books you may find useful to read. There is also a list of websites and special groups to help and support you at this time.

Reading this booklet

Remember you do not need to know everything about ovarian cancer straight away. Read a section about a particular item as it happens to you. Then when you feel relaxed and want to know more, read another section.

If you do not understand something that has been written, discuss it with your doctor or nurse. You can also call the freephone National Cancer Helpline on 1800 200 700. It is open Monday to Thursday 9am–7pm and Friday 9am–5pm.

What does that word mean?

Abdomen The part of your body that lies between your chest and hips.
Adjuvant treatment Treatment given soon after surgery when a diagnosis of cancer is made.
Alopecia Loss of hair or baldness. No hair where you normally have hair.
Benign Not cancer. A tumour that does not spread.
Biopsy Removing a small amount of tissue from your body to find out if cancer cells are present.
Cells The building blocks that make up your body. They are tiny and can only be seen under a microscope.
Chemotherapy Treatment using drugs that cure or control cancer.
Fatigue Ongoing tiredness often not relieved by rest.
Grading Tests that look at the appearance of cancer cells under the microscope.
Malignant Cancer. A tumour that spreads.
Medical oncologist A doctor who specialises in treating cancer patients using chemotherapy and other drugs.
Metastasis The spread of cancer from one part of your body to other tissues and organs.
Nausea Feeling sick or wanting to be sick.
Oncology The study of cancer.
Radiotherapy The treatment of cancer using high-energy X-rays.
Radiation oncologist A doctor who specialises in treating cancer patients using radiotherapy.
Staging A series of tests that measure the size and extent of cancer.
Before diagnosis

What is cancer?
Cancer is a word used to describe a group of diseases. Each one has its own name. For example, skin cancer, lung cancer and breast cancer. Each has an individual type of treatment and chance of being cured.

In your body, your organs and tissues are made up of tiny building blocks called cells. All cancers are a disease of the body’s cells. In healthy tissue these cells replace or repair themselves when they get worn out or injured. With cancer, the cells do not behave as normal and keep on growing even when there is no need.

These groups of abnormal cells can form a lump or tumour. Tumours can either be benign or malignant. Benign tumours do not spread to other parts of the body and are not called cancer. Malignant tumours are cancer cells that can spread from where they first grew. This happens when a cell or group of cells breaks away and is carried by your bloodstream or lymph vessels to form a new tumour somewhere else in your body. This is called a metastasis or secondary tumour. Lymph glands and nodes help to protect your body against infection.

To sum up
- Cancer is a disease of the cells of your body.
- With cancer, the cells do not behave as normal. They keep on growing even when there is no need.
- If a tumour is malignant, cells can break away and be carried by the bloodstream somewhere else. This is called a metastasis or secondary tumour.

What are the ovaries?
The ovaries are part of the female reproductive system. They are two small oval-shaped organs on each side of your womb in your lower abdomen (pelvis). Each month, if you are fertile, an egg is made in one of your ovaries. The egg leaves your ovary and passes down a tube called the fallopian tube to your womb. If the egg is not fertilised by sperm, it leaves your womb with the lining of the womb. This happens as part of a monthly cycle known as a period (menstruation). The ovaries make the female sex hormones, oestrogen and progesterone, which control your periods.

You are fertile from the age when periods start (puberty) to when they stop (menopause). During the menopause less hormones are made, so periods gradually stop.
Understanding cancer of the ovary

What is ovarian cancer?
When cancer occurs, the cells in the ovary change to form a tumour. Because the ovaries are deep in your pelvis the tumour may cause very few symptoms in the early stages. As the tumour gets bigger it may affect tissues and organs nearby such as your bladder or bowel. When this happens the tumour may upset the way these tissues and organs normally work. This in turn can lead to symptoms. When the tumour is malignant, cells may break away from it and spread to other parts of your body.

How common is ovarian cancer?
Ovarian cancer is the fifth most common cancer in women. Each year about 350 women are diagnosed with it in Ireland.

Can I be screened for ovarian cancer?
Testing for ovarian cancer when you have no symptoms is called screening. There is no national ovarian screening programme in Ireland at present. This is because so far no one test has been definitely proven to find ovarian cancer at an early stage. Cervical screening tests (smear tests) do not pick up signs of ovarian cancer.

To sum up
- The ovaries are part of the female reproductive system.
- The normal cells in the ovary may change and grow to form a malignant tumour.
- The tumour can affect nearby tissues and organs.

What causes ovarian cancer?
The exact cause of ovarian cancer is unknown. But there are certain things called risk factors that can increase your chance of getting the disease. Even so, having a risk factor does not mean that you will get ovarian cancer. Some risk factors include:

- **Age:** Your risk increases with age. Ovarian cancer usually affects women over the age of 55.
- **Family history of cancer:** A faulty gene can lead to ovarian cancers in a very small number of women. It is also linked to the faulty genes found in breast cancer. If you or a member of your family have a history of ovarian, breast, womb or bowel cancer, your risk is higher. If your mother or sister gets ovarian cancer, you have an even higher risk of the disease.
- **Childless:** If you have never been pregnant or have no children, your risk is higher.
- **Hormone replacement therapy (HRT):** If you take the hormone estrogen for 10 or more years, your risk of ovarian cancer may be higher.
- **Infertility and fertility treatments:** Being infertile or drugs used in fertility treatment may slightly increase the risk of ovarian cancer. Research is still looking into this risk.

It is not clear if being obese or using talcum powder are risk factors. But if they are, they are not strong risk factors. Research has shown that women who take the contraceptive pill are less likely to develop ovarian cancer.

If you feel you may be at risk, visit your family doctor (GP) and talk about your concerns. There are specialist clinics for people worried about the risk of ovarian cancer in their family. They will advise you on what to do. You can also contact the National Cancer Helpline on 1800 200 700 for more information.

To sum up
- The ovaries are part of the female reproductive system.
- The normal cells in the ovary may change and grow to form a malignant tumour.
- The tumour can affect nearby tissues and organs.

What causes ovarian cancer?

If you feel you may be at risk, visit your family doctor (GP) and talk about your concerns. There are specialist clinics for people worried about the risk of ovarian cancer in their family. They will advise you on what to do. You can also contact the National Cancer Helpline on 1800 200 700 for more information.

Can I be screened for ovarian cancer?
Testing for ovarian cancer when you have no symptoms is called screening. There is no national ovarian screening programme in Ireland at present. This is because so far no one test has been definitely proven to find ovarian cancer at an early stage. Cervical screening tests (smear tests) do not pick up signs of ovarian cancer.

Talk to your GP if you feel you or your family are at risk. If you have a strong family history of ovarian or breast cancer, you may wish to have genetic testing for yourself and the women in your family. Genetic tests can sometimes show if you have the inherited faulty gene that increases the risk of ovarian cancer.
Understanding cancer of the ovary

How is ovarian cancer diagnosed?

Most people start by visiting their family doctor (GP). If your GP has concerns about you, he or she will refer you to a hospital to see a gynaecologist and have further tests. Or you might be seen by a gynaecological oncologist, who treats cancers of the female reproductive system. At the hospital you will be asked questions about your health before a physical exam is done. A blood test and a chest X-ray may be taken to check your general health.

The tests below are all used to diagnose ovarian cancer. If cancer is found, other tests will be done to show the stage of the cancer and check if it has spread to other parts of your body or not. This helps your doctors to plan the best treatment for you.

- Internal exam
- X-rays, such as a chest X-ray
- Special tests to look inside your abdomen
- Blood tests

Internal exam: Your doctor will place a gloved finger into your vagina to feel for lumps or swelling. He or she will examine your back passage (rectum) in the same way. These quick tests may be uncomfortable but are not painful.

Special tests

You may need some of the following tests:
- Transvaginal ultrasound scan
- Ultrasound of abdomen
- CT scan
- MRI scan
- Laparoscopy
- Abdominal fluid aspiration
- Plural fluid aspiration
- Laparotomy

Transvaginal ultrasound scan: This test is carried out in the X-ray department of the hospital. A picture is built up of the inside of your body using sound waves. Before the test you must empty your bladder. You will then be asked to lie on your back. A small metal...
device called a probe is put into your vagina. It looks like a microphone and gel is placed on it. By doing the test in this way clear pictures of your womb and ovaries can be taken. This test may be uncomfortable but is not painful.

**Ultrasound of abdomen:** Before this test you will need to drink plenty of clear fluids and not pass urine until afterwards. You lie on your back and gel will be spread over the area to be scanned. A probe that makes sound waves is used to take the scan. The sound waves are changed into a picture by a computer. This test does not hurt and only lasts about 10 minutes.

**CT scan (CAT scan):** This is a special type of X-ray that gives a detailed picture of the tissues inside your body. The scan is painless. For some CT scans you may be asked to fast for 4 hours beforehand. For others you may be given a special drink which helps show up parts of your body on the scan. Preparation for a CT scan can vary but your doctor or nurse will tell you what to do. The test is usually done as an outpatient.

**MRI scan:** This is a special scan that uses magnetic energy to build up a picture of the tissues inside your body. It does not hurt but can be very noisy. So you will be given earplugs to wear during it. You might have an injection before the scan to show up certain parts of your body. You cannot wear metal jewellery during the scan. If you have any medical device like a pacemaker or metal piece in your body, you may not be suitable for the test. Most people go home after the scan.

**Laparoscopy:** This test allows your doctor to look at your ovaries and nearby tissues. It is a small operation done in theatre under a general anaesthetic. Just before the test you may be given a sedative. This will help you feel more relaxed before going to theatre.

While you are asleep your doctor makes a small cut in your lower abdomen, near your belly button. He or she then puts a thin mini-telescope called a laparoscope into the wound. By looking through the laparoscope your doctor can see your ovaries and take a small sample of tissue (biopsy) and have it examined.

During the operation, carbon dioxide gas is put in your abdominal cavity. This may give you uncomfortable wind afterwards or shoulder pains for 3 or 4 days. Taking sips of peppermint water often eases the pain. Some people find walking about helps too. After a laparoscopy you will have one or two stitches at the wound site. Most people are ready to go home as soon as the effects of the anaesthetic have worn off. You will have to arrange for someone to take you home, as you may be feeling sleepy. You will not be able to drive for several hours.

**Abdominal fluid aspiration:** If you get a build-up of fluid in your abdomen a sample can be taken to see if it has any cancer cells. Your doctor will first numb a small area of your abdomen before putting a small needle through your skin. Some fluid is taken and then examined under a microscope.

**Plural fluid aspiration:** In rare cases there may be a build-up of fluid in the space around your lungs. A sample can be taken to check for any cancer cells. Your doctor will first numb a small area on your chest before putting a small needle through your skin. Some fluid is taken and then examined under a microscope.

**Laparotomy:** Sometimes cancer cannot be diagnosed until a full operation called a laparotomy is done. See page 21 for more information.

**Special blood tests:** A blood test called CA125 will be done. CA125 is a chemical found in the blood that is sometimes released from ovarian cancer cells. It is known as a tumour marker for ovarian cancer. Not all women with ovarian cancer will have high levels of CA125 in their blood. But if there is a high level of CA125 in your blood at time of diagnosis, it may give your doctor extra information. He or she can use it in planning your treatment. It will also help your doctor to measure how well you are doing on treatment.
Understanding cancer of the ovary

Less common tests
Some people may need extra tests, depending on their symptoms. These include:

Barium enema: This is an X-ray of your bowel. It allows your doctor to look at areas of your bowel that may be affected by the ovarian tumour.

Colonoscopy: This is a test on your bowel using a tiny camera. It can check the lining of your bowel to see if cancer cells are present.

Gastroscopy: This is a test on your stomach using a tiny camera. It can check the lining of your stomach to see if there are cancer cells present.

It will take about a week for all the test results to come back. This can be an anxious time for you. It may help to talk things over with a relative or close friend. You may also wish to call the National Cancer Helpline 1800 200 700 and speak to one of our specially trained nurses.

Staging of ovarian cancer
Some of the tests mentioned above can find out what stage your cancer is at. This means finding out the size of the tumour and checking to see if it has spread to other parts of your body. This can help your doctor to decide what the best course of treatment is for you.

There are a number of ways to stage ovarian cancer but the one most commonly used is the following:

Borderline tumours
Borderline tumours have cells that are very like normal cells in your ovary. They usually grow slowly and have not spread into the normal tissue around your ovary. Usually they are fully cured by surgery.

Stage 1
Here the cancer affects only your ovaries.
- Stage 1a – The cancer is in one ovary only.
- Stage 1b – The cancer is in both ovaries.
- Stage 1c – There is fluid with cancer cells in your abdomen (ascites).

Stage 2
Here the cancer has spread outside your ovary but is still within your pelvis.
- Stage 2a – The cancer cells have spread to organs near your ovary, such as your vagina, womb or fallopian tubes.
- Stage 2b – The cancer has spread to other organs in your pelvis, such as your lower bowel or bladder.
- Stage 2c – The cancer has spread to other organs in your pelvis. Some fluid with cancer cells may be within your pelvis.

Stage 3
Here the cancer has spread outside your pelvis and into your abdominal cavity. It can affect the lining of your abdomen or lymph nodes there.
- Stage 3a – The cancer in your abdomen is tiny and can only be seen under a microscope.
- Stage 3b – The cancer in your abdomen can be seen but is smaller than 2cm across.
- Stage 3c – The cancer in your abdomen is larger than 2cm.

Stage 4
Here the cancer cells have spread to other parts of your body. This could be your lungs, liver or lymph nodes in your armpit or neck.

Recurrent ovarian cancer
This means that the cancer has come back (recurred) after you have completed treatment.

Grading of ovarian cancer
It is also possible to grade the cancer cells. This refers to their size and appearance under the microscope. They are checked to see how much they are like or unlike normal cells.

They are graded 1 to 3.
- Grade 1 or low grade: the cancer cells are very like normal cells in your ovary. They usually grow slowly and are less likely to spread.
- Grade 2 or moderate grade: the cancer cells look less like normal ovarian cells.
Understanding cancer of the ovary

Treatment and side-effects

How is ovarian cancer treated?

The type of treatment you receive will depend on:

- The size of your tumour
- If it has spread or not
- Your general state of health
- Your own preferences and lifestyle

Cancer treatment

Ovarian cancer is treated in specialist cancer centres in Ireland. The staff at these centres have great expertise in managing patients with ovarian cancer. As a result, you may be transferred to another hospital from the one where you received your diagnosis.

Types of treatment

Treatments for ovarian cancer can include:

- Surgery
- Chemotherapy
- Radiotherapy

Surgery: Surgery is one of the main treatments for ovarian cancer. Your surgeon may need to do an operation called a laparotomy first to diagnose the cancer. After that, he or she may need to remove your ovaries, womb and fallopian tube. This is called a total abdominal hysterectomy and bilateral oophorectomy. Other tissues may need to be removed as well if the cancer has spread. This is called debulking surgery. See page 21 for more details on surgery.

Chemotherapy: Chemotherapy is the use of drugs to kill or control the cancer cells. Sometimes two or three courses can be given before surgery, especially if the tumour is large and sticking to nearby tissues and organs. The drugs help to shrink it and make it easier to remove. See page 25 for more about chemotherapy.

To sum up

- There are a number of tests to diagnose ovarian cancer.
- These tests include a transvaginal ultrasound, abdominal ultrasound, CT scan, MRI scan, laparoscopy, CA125 blood test.
- Sometimes an operation is the only way to diagnose ovarian cancer.
- Some tests will also show the stage of the cancer.
- Ovarian cancers can be staged as borderline tumours, stages 1 to 4, or recurrent cancer.
- Ovarian cancers can be graded 1 to 3: low grade, moderate grade or high grade.

Grade 3 or high grade: the cancer cells are very unlike normal ovarian cells. They usually grow quicker and are more likely to spread.

Usually the higher the grade, the more quickly the cancer is likely to grow.
Radiotherapy: This involves using high-energy X-rays to kill the cancer cells. It is used less often for ovarian cancer but might be given along with chemotherapy and surgery. It might also be used to relieve symptoms such as pain and bleeding if the cancer comes back after the first treatment. See page 32 for more about radiotherapy.

Deciding on treatment
At this time you may be anxious about what is going to happen next. Do not be afraid to ask for more information.

Treatment options: Your doctor and nurse will explain your treatment options to you. Sometimes, depending on the stage of your cancer, you may have fewer choices.

Do ask as many questions as you like, no matter how small or trivial you think they are. All questions are important. Sample questions are given at the back of the booklet.

Time to think: When faced with a life-threatening illness, it can be hard to decide what the right treatment is for you. It may feel as if everything is happening too fast. You may feel under pressure to make a decision. You might want more time to think things through. But remember there is always time for you to consider what sort of treatment you want.

Second opinion: You might also find it reassuring to have another medical opinion to help you decide about your treatment. Your doctor will refer you to another specialist for a second opinion if you feel this would be helpful.

Accepting treatment: You have the right to find out what a treatment option means for you, and the right to accept or refuse it. If you wish to refuse treatment, let your doctor or nurse know your concerns first. It may help to talk to your GP as well. The important thing is that you are fully informed of the benefits and risks.

Giving consent for treatment
You may be asked to sign a consent form saying that you give permission for the treatment to take place. No medical treatment can be given without your consent. Before treatment, you should know:
- The type of treatment you are advised to have
- The benefits and risks of the treatment
- Any other treatments that may be available
- Any major side-effects of the treatment

If you are confused about the information given to you, let your doctor or nurse know straight away. They can explain it to you again. Some treatments can be hard to understand and may need to be explained more than once. You can always ask for more time to decide about the treatment, if you are unsure when it is first explained to you.

Individual treatment
You may notice that other people with ovarian cancer are not getting the same treatment as you. Their cancer may not be the same type or at the same stage as yours. Everyone’s treatment needs will be different. Do not be afraid to ask your doctor about your own treatment.
Surgery

Sometimes surgery is needed to make a diagnosis first. The main aim of surgery is to remove all of the tumour or as much as possible of it. Surgery may be done before or after chemotherapy. The type of surgery you have will depend on:
- The type of tumour
- The size of the tumour
- If the cancer has spread to other tissues and organs.

Sometimes your surgeon may only find out this information during the operation. Before any operation, make sure you discuss all the possible options with your surgeon.

Laparotomy

An operation that opens up your abdomen is called a laparotomy. During this operation the organs and tissues of your abdomen are carefully examined and biopsies (tissue samples) are taken. If the cancer is found in only one ovary at an early stage and you wish to have children in the future, it may be possible to remove the affected ovary and leave your other ovary and your womb in place.

In most cases, your surgeon will have to carry out a total hysterectomy and bilateral salpingo-oopherectomy. This is an operation where your two ovaries, fallopian tubes and womb (uterus) are removed. If the cancer has spread, your surgeon may also remove the omentum and as much of the tumour as possible. This is known as debulking surgery. The omentum is a layer of fatty tissue that surrounds your stomach and other organs in your abdomen. Your surgeon may also take samples from other tissues, such as lymph glands, to see if the cancer has spread further.

Colostomy

Sometimes if the tumour has spread to your bowel a small piece of bowel may be removed and the two ends joined back together. In some cases it is not possible to join up the bowel again. Instead the bowel is brought out onto the surface of your abdomen through a cut in your skin. This is called a colostomy.
After surgery

When you wake up you will notice a number of tubes attached to your body. They may look alarming but are normal after an operation like this.

- A drip will be put into a vein in your arm. Through this you will be given fluids until you can drink again.
- A thin plastic tube may be placed in your nose and lead down into your stomach. By drawing up the fluid in your stomach through this tube, the nurses can keep your stomach empty. This will stop you from feeling sick.
- A small thin tube called a catheter may be put into your bladder and urine drained off into a drainage bag. This will save you having to get out of bed to go to the toilet.
- There may be drainage tubes from your wound to make sure it heals well.
- You may have a thin epidural catheter in your back to help with pain relief.

Pain: You will have some pain for the first few days. You might also feel sick. Your nurses can give you painkilling injections and medication to prevent you feeling or getting sick if you need it. Always ask for help before the pain or sickness gets too bad. If the injections do not work let your nurse know as they can be changed.

Your doctor may arrange for you to have patient controlled analgesia (PCA). This is a small infusion pump where you safely control the amount of painkillers you get. You push a button and the pump sends the painkiller into your bloodstream through a vein.

Eating and drinking: This type of operation slows down the movement of your bowel. As a result, it will take a few days before you can return to normal eating and drinking. You will soon be able to take sips of water again. The amount of fluids you can take will then be increased. Most people can manage a light meal within 2 or 3 days of surgery. As you begin to drink again the drip will be removed.

Getting up and about: A physiotherapist will visit you everyday for the first few days to help you with your exercises. Even when you are in bed you will be encouraged to move your legs and do deep breathing exercises at least once an hour. On the day after surgery your nurses will...
help you get out of bed and take you for a short walk. These walks will become more frequent and longer as you get better. Soon you can go for walks on your own. Sitting down may be uncomfortable at first but should get better as your wound begins to heal. Most women are ready to go home 8 to 10 days after surgery.

Strenuous activity such as vacuum cleaning or lifting heavy bags of shopping should be avoided for at least 3 months. You will not be able to drive for at least 6 weeks after surgery. Your doctor will discuss this with you in more detail.

Going home: If you live alone or have problems getting around the house, talk to the medical social worker or nurse on your ward as soon as you are admitted to the hospital. This is so he or she can organise the community services that you may need after you leave hospital. On the day you go home you will be given a date to come back for a check-up in about 6 weeks’ time.

If you have a worry or symptom that is causing you concern before your check-up date, contact your doctor, cancer nurse specialist or hospital ward for advice.

Second-look laparotomy: Sometimes after two or three courses of treatment or at the end of chemotherapy, your surgeon may want to look inside your abdomen again. By doing this he or she will find out how well the disease has responded to treatment. This second-look laparotomy does not mean that the cancer has returned or got worse. Often it is done to help your surgeon decide if further treatment is needed or not. Sometimes the laparotomy is done because it becomes possible to remove any remaining cancer after a few courses of chemotherapy. This is known as interval debulking surgery.

Lymphoedema: This is swelling in one or both of your legs if your lymph glands are removed during surgery. When the glands are removed, they can no longer drain away excess fluid in your body, so a build-up of fluid can occur in your legs over time. There are various ways to help drain the fluid, such as exercises, elastic stockings and manual lymph drainage. Your physiotherapist will give you more information. For a factsheet on leg lymphoedema, call the National Cancer Helpline on 1800 200 700.

---

**Chemotherapy**

Chemotherapy is a treatment using drugs that cure or control cancer. These drugs can be used on their own or with each other. This treatment may be given before or after surgery. The drugs used in chemotherapy travel through your bloodstream to almost every part of your body. They are often given in cycles such as once every 3 weeks with a rest period between treatments.

**How is chemotherapy given?**

Chemotherapy may be given directly into a vein as an injection or through an infusion or drip. It may also be given in tablet form. If your treatment is given by infusion into the vein, you may need to stay overnight in hospital. However, there are some treatments that may be given as a day patient.

A PICC line gives chemotherapy drugs into a vein in your arm

Chemotherapy can also be given directly into your tummy (abdomen) through a small tube. This is known as intraperitoneal chemotherapy. These drugs can destroy or control cancer in your abdomen and pelvis. Research has shown that intraperitoneal chemotherapy, when given with chemotherapy into a vein, can help to improve survival for a small number of women.

**When is chemotherapy given?**

Sometimes two or three courses of chemotherapy are given before surgery. This happens when the tumour is large and possibly sticking to other tissues and organs. The chemotherapy may shrink the tumour and make the operation easier and more effective. Once you have recovered from surgery you may need further chemotherapy.
In some cases, it may not be possible to remove the entire tumour during surgery. Or there may be a risk that some cancer cells were left behind. This is more likely if the tumour has spread outside your ovary. The cancer may have released cells into your bloodstream or lymphatic system. These cells can sometimes cause secondary cancers called metastases in other parts of your body.

If the cancer has spread to your liver or beyond your abdomen and/or surgery is not possible for other reasons, chemotherapy is the main treatment used. Even if the cancer comes back after surgery or a course of chemotherapy, it can still be treated. Your doctor will consider your general health and where the cancer has spread. He or she will also take into account the kind of drugs you have had in the past.

Even if the cancer comes back after surgery or a course of chemotherapy, it can still be treated.

Types of drugs used

There are several chemotherapy drugs used to treat ovarian cancer. Two of these drugs are carboplatin and paclitaxel (Taxol®). They are often used together and are given to patients with newly diagnosed ovarian cancer. Cyclophosphamide might be given instead of Taxol®. Carboplatin and Taxol® can also be used if the cancer comes back after surgery or when chemotherapy already given is no longer working.

The two drugs can be given as a day treatment. Carboplatin and Taxol® are given into the vein as an infusion over 3–4 hours. This one-day treatment is repeated every 3 to 4 weeks for about 6 months. The rest period between treatments allows your body time to recover from the side-effects of treatment.

Topotecan is another drug that is sometimes given in ovarian cancer either together with other drugs or on its own. It may be used to treat ovarian cancer which has not responded to other treatment or has come back after surgery. Another chemotherapy drug used to treat ovarian cancer is liposomal doxorubicin (Caelyx®).
During treatment cycles you will have blood tests to make sure that you have enough white blood cells. If your white cell count is low, your doctor may ask you to watch out for signs of infection. These signs include feeling shivery and unwell or running a high temperature of 38°C or higher. If this happens, tell your doctor straight away. He or she will tell you what to do. Some hospitals prefer you to ring them directly. Check this out with your doctor or nurse before you start treatment. If you have a high temperature, you will need to have a blood test taken. Sometimes antibiotics are needed to treat the infection.

If you feel shivery and unwell or have a high temperature of 38°C or higher, contact your hospital doctor straight away.

You will be more at risk of picking up infections while on treatment. Try to avoid close contact (such as hugging or kissing) with people who have colds or flu or other infections such as chickenpox, shingles or measles. Let your doctor know if you are in contact with these or any other infections. Wash your hands often during the day, especially before you eat and after going to the bathroom.

Bruising: You may notice that you bruise more easily or for no good reason. Platelets help to clot your blood if you hurt yourself and bleed. If there are not enough platelets in your blood (thrombocytopenia), you may bleed or bruise more easily than usual, even from a minor injury. Let your doctor or nurse know straight away if you are bruising easily or notice tiny red spots under your skin that can look like a rash (petechiae). He or she will tell you what to do.

Feeling very tired: You may feel very tired or fatigued. This may be due to less red blood cells (anaemia) in your bloodstream or as a general effect of chemotherapy. If you are anaemic you may have some shortness of breath, feel weak or dizzy or have no energy. Your doctor might order a blood transfusion or medication if your red cell count is very low.

General tiredness can last for some weeks after treatment has ended. If this happens take things easier and rest more if you can. Do less than you would normally do. Ask your family or friends to help you at work or at home. Do tell your doctor about the way you are feeling during your treatment as most side-effects can be eased with medication. See page 37 for more about fatigue.

A helpful booklet called *Coping with Fatigue* is available from the Irish Cancer Society. Call the National Cancer Helpline 1800 200 700 for a free copy.

### Tips & Hints – infection, bleeding, anaemia

- Contact the hospital immediately if you have a temperature of 38°C (100.4°F) or higher, shortness of breath or bleeding that cannot be stopped.
- Take plenty of rests and breaks if you are feeling tired or fatigued.
- Avoid crowds and close contact, such as hugging or kissing, with people who have colds, flu's and other infections, especially chickenpox, shingles or measles. Let your doctor know if you have been in contact with these infections.
- Wash your hands often during the day, especially before eating and after going to the toilet.
- Avoid unpasteurised milk, soft cheeses, undercooked meats and poultry, the skin of raw vegetables and of fresh fruit.
- Take care to avoid injury. Avoid contact sports. Use an electric razor when shaving, a soft toothbrush when cleaning your teeth, and thick rubber gloves when gardening.
- Do not take aspirin as it can increase your risk of bleeding.

Nausea and vomiting: Not everyone feels sick (nausea) or gets sick with chemotherapy. It depends on the drugs being given. If you do, it can happen before, during or after treatment. It may last for several hours. But your doctor or nurse will give you medication to stop you feeling sick. This may be in injection or tablet form. It is important that you take all medication while on treatment.
Hair loss (alopecia): The amount of hair loss you get will depend on the drugs you are given. This can vary from person to person. You may notice that your hair just thins out a little bit. If you do lose your hair, it will happen quite quickly. Try not to worry as your hair will grow again when treatment ends. You may feel upset at the thought of losing your hair. Talk to your nurse about your feelings. He or she will help you to find ways to cope with hair loss. You can get a wig or hairpiece when this happens or you may prefer to wear a hat, turban or scarf.

If you would like a hairpiece try to organise this before your hair falls out. Your medical social worker or nurse will be able to help you with this. If your hospital does not have a social worker, ask if they have the name of a wig fitter you could go to see. Your local hairdresser may also be able to help. In some cases it is possible to get financial assistance towards the cost of a wig. Ask your medical social worker or nurse for more information about this. For some patients the amount of hair loss is small and a wig may not be needed.

Contact the National Cancer Helpline 1800 200 700 for more advice or a copy of the factsheet on Hair Loss and Cancer Treatment.

Sore mouth: Some drugs used to treat ovarian cancer may cause a sore mouth. They can also cause little ulcers to appear on your tongue, gums and inside the cheeks of your mouth. Try to keep your teeth, gums and mouth very clean, as this will reduce the risk of getting a mouth infection. Clean your teeth after every meal using a soft toothbrush. If you have dentures remove them if your gums are sore. There are also special mouthwashes and gels that you can use. Your nurse will show you how to use these properly.

Numbness or pins and needles in the hands and feet: Some chemotherapy drugs can cause tingling or burning sensations in your hands and feet. You may also have trouble picking up small objects or buttoning up a shirt or cardigan. This is called peripheral neuropathy. This side-effect is almost always temporary and goes away after treatment stops. It is best treated by preventing further damage to your nerves and reporting symptoms early. Sometimes painkillers are prescribed to relieve any pain. For more about this side-effect, call the National Cancer Helpline on 1800 200 700. Ask for a copy of the factsheet on peripheral neuropathy.

Not wanting to eat: Do eat as much as you can while on chemotherapy to keep up your strength. It helps to eat smaller amounts more often. If you do not feel like eating during treatment, you could try replacing some meals with special high-calorie drinks. Talk to the hospital dietitian who can give you advice. A helpful booklet on what to eat is called Diet and Cancer and is available from the Irish Cancer Society. Call the National Cancer Helpline 1800 200 700 for a free copy.

Sore and red palms of hands and soles of feet: You may develop sore and red palms in your hands and soles of your feet. Sometimes this is known as palmar plantar or hand–foot syndrome. It can begin after two or three cycles of treatment but is temporary. You may be prescribed vitamin B6 (pyridoxine) to help to reduce it. It is best to keep your hands and feet cool and avoid any tight-fitting clothes like socks, shoes and gloves.

Other side-effects: If you have a different side-effect or symptom from those listed above that concerns you, tell your doctor or nurse straight away. He or she will tell you what to do. A helpful booklet called Understanding Chemotherapy is available from the Irish Cancer Society. Call the National Cancer Helpline 1800 200 700 for a free copy.

To sum up
- Chemotherapy is a treatment using drugs to cure or control cancer.
- The drugs can be given directly into a vein as an injection or in a drip, or may be given in tablet form or directly into your abdomen (intraperitoneal).
- Chemotherapy can be given before surgery, after surgery, or even if the cancer comes back after having been treated with chemotherapy already.
- Side-effects to chemotherapy vary between people and depend on the drugs used.
- Side-effects may include infection, bruising, nausea and vomiting, hair loss (alopecia), sore mouth, numbness or pins and needles in your hands and feet, feeling very tired and not wanting to eat.
Radiotherapy

This is a treatment where high-energy X-rays are aimed at a cancer to cure or shrink it. Usually the X-rays come from a machine called a linear accelerator. This is known as external radiotherapy. Radiotherapy may be used along with chemotherapy and surgery to treat your cancer. The treatment may be as short as one session or continue for several weeks, depending on the stage of ovarian cancer.

Radiation can be given to your whole abdomen. But it is more usually given to your pelvic area to control or relieve any symptoms you may have. This could include any pain, discomfort or bleeding if the cancer comes back after having been treated.

Planning your treatment

Before radiotherapy your doctors and other specialists plan how to give it to you. They work out how to give you the right amount of radiotherapy with the least damage to normal cells. On your first visit to the radiotherapy department, you may be asked to lie under a machine called a simulator that takes X-rays of the area to be treated. Treatment planning is an important part of radiotherapy and it may take a few visits before your treatment can go ahead.

Your skin in the area to be treated will be marked. This may be with ink or a permanent tattoo. This is so the rays can be aimed at the same area each day. The ink marks are temporary and should not be washed off until treatment is over. Before starting radiotherapy, you will be told how to look after your skin during and after treatment.

Getting your radiotherapy

Radiotherapy treatment is quite straightforward. You will be asked to come for treatment every day during the week with a rest at weekends. Your treatment can go on for several weeks. Each treatment session only lasts a few minutes. It will not cause you any pain during treatment but you will be asked to lie still. How much treatment you need will depend on the type and size of the tumour. Your doctors will discuss this with you.

Each time you come for treatment you will go into a radiotherapy room. The radiation therapist will ask you to lie or sit in a certain position under the machine. To make sure less radiation reaches your small bowel and so reduce any side-effects, a special piece of equipment called a belly board will be fitted to you.

When you are ready your radiation therapist will leave the room. The machine will then be turned on and your treatment given. Even though you are on your own in the room, your radiation therapist can see you all the time through a closed circuit camera. You can talk through an intercom to the staff if you wish.

External radiotherapy does not make you radioactive. It is perfectly safe for you to mix with family and friends.

Will I have any side-effects?

Radiotherapy is given directly to the area where the cancer is found. As a result, the side-effects that occur are related to the part of your body being treated. How severe these side-effects are will vary from person to person and depend on the amount of treatment received.

When the pelvic area is being treated, the most common side-effects are:

- Diarrhoea
- Tiredness
- Skin changes
- Nausea
- Wanting to pass urine more often
Understanding cancer of the ovary

All these side-effects should go away when treatment is over, but do let your doctor know if they continue. A helpful booklet called Understanding Radiotherapy is available from the Irish Cancer Society. Call the National Cancer Helpline 1800 200 700 for a free copy.

Long-term effects of radiotherapy

There can also be long-term side-effects of radiotherapy. They will depend on which part of your body is treated, so you might not experience all of them. These long-term side-effects can take months or even years to develop. They may include some of the following:

- Bowel symptoms like diarrhoea, urgency, frequent bowel motions or leakage
- Urinary symptoms like frequency, urgency or a burning sensation
- Tiredness (fatigue)
- Early menopause
- Infertility – if your ovaries are within the treatment area
- Your vagina may become narrower, making sex difficult and uncomfortable

For more information on the long-term side-effects of radiotherapy, contact the National Cancer Helpline on 1800 200 700. For more about lymphoedema, see page 24.

To sum up

- Radiotherapy is a treatment using high-energy X-rays or radiation.
- The X-rays are aimed at the cancer to cure or shrink it.
- There is a lot of preparation before the actual treatment is given.
- Radiotherapy is painless and only takes a few minutes.
- The treatment may be as short as one session or continue for several weeks.
- Side-effects to radiotherapy depend on the area being treated. They include diarrhoea, tiredness, skin changes, feeling sick, and wanting to pass urine more often.
Understanding cancer of the ovary

Early menopause

The result of removing the ovaries in younger women is that they will experience an early menopause. This may involve having hot flushes, dry skin, dryness of your vagina, reduced sexual desire (libido), night sweats, mood swings and osteoporosis.

Most of these effects can be prevented or reversed by replacing the hormones that your ovaries normally made. Your doctor may prescribe hormone replacement therapy (HRT) after treatment for ovarian cancer. It can be given in different ways. For example, in tablet form or through an implant device put under your skin, or by a slow release patch worn on your arm or leg.

Dryness of the vagina that makes sex uncomfortable can be eased by using vaginal lubricants. For example, KY gel. These can be bought in your local pharmacy.

Will treatment affect my sex life and fertility?

After a hysterectomy, women often ask if the surgery will affect their sex life. To allow your wound to heal properly it is best to wait at least 6 weeks before having sex again. Many women have no problem resuming intimacy and sex after this time. Others may need more time to come to terms with what has happened.

If you have a supportive partner, you may find that talking about your feelings may ease your anxiety. Even if you do not feel like having sex, you can still enjoy a close and loving relationship with your partner. Do not feel guilty or embarrassed to talk to your doctor or nurse about what is troubling you. He or she may refer you for specialist counselling if you feel that would be helpful. For example, to a psychosexual counsellor.

Sometimes there may be a physical reason why you lose the desire for sex. For younger women who are still having periods, the removal of the ovaries will bring on an early menopause. See page 37 for more details. There may also be a change of body image, especially if you have a colostomy.

Remember that cancer cannot be passed on to a partner during sex. It is quite safe for you to resume sex with your partner.

How will my fertility be affected?

After a hysterectomy, younger women often find it hard to accept that they can no longer have children. Indeed infertility may cause feelings of anger or loss of identity. But it is natural to feel this way at this time.

It is important to talk openly to your partner or a friend about these feelings. If you are finding it hard to deal with infertility it may also be helpful to talk to your nurse or doctor. If you cannot deal with any strong emotions you might have, your doctor may arrange for you to speak to a trained counsellor or a specialist. Do seek professional help if infertility is likely to trouble you.

Hints & Tips – coping with early menopause

- Dress in layers, so you can cool off easily if you do have a hot flush.
- Avoid caffeine and alcohol.
- During sex use a vaginal lubricant that is based on water or mineral oil (e.g. KY gel).
- If sex continues to be painful, discuss alternative treatments.

How can I cope with fatigue?

Fatigue is a common symptom of cancer and described as an overwhelming tiredness. Often it is not relieved by rest. You also may find it hard to concentrate or make decisions. The reason for your fatigue can sometimes be hard to identify. It may be caused by anxiety over a cancer diagnosis or the added stress caused by treatment. Whatever the reason, there are things you can do to help.

For many patients, treatment may help by relieving symptoms such as pain and nausea, allowing you to get back to your normal routine.
Ask your doctor before you start treatment what side-effects you can expect.

If you are feeling very worried, you may find it hard to sleep at night. Do tell your doctor or nurse, who may be able to help. Also, try talking to your family or close friends about your concerns. If you find this difficult, ask to see a counsellor. He or she will help you to find ways to cope.

If your illness allows you to do physical exercise, get some regularly. For example, a 30-minute walk 3 days a week might be a realistic goal and will boost your morale when you achieve it. Get others to help you around the house, with travelling to hospital, at work, with the children or with shopping. Use the extra free time to do something that you especially enjoy.

A helpful booklet called *Coping with Fatigue* is available from the Irish Cancer Society. Call the National Cancer Helpline 1800 200 700 for a free copy.

---

### What follow-up do I need?

No matter what type of cancer treatment you get, you will still need to come back for regular check-ups once it is over. This is called follow-up. At first these visits to your doctor will be quite often. Follow-ups may include seeing your doctor and having some tests such as blood tests and scans. Every 3 months you will need a pelvic and rectal exam by your gynaecologist.

These visits will continue for a number of years but will grow less frequent over time.

If you are between check-ups and have a symptom or problem that is worrying you, let your doctor know. Make an appointment to see him or her as soon as possible.

---

### Tips & Hints – fatigue

- Build rest periods into your day. If you are going somewhere special, have a rest before you go out.
- Save your energy for doing the things you most enjoy.
- Ask for help at work or with cooking, housework or childcare.
- Keep your energy for eating. Eat little and often and use ready-made meals or snacks.
- Wear clothes that are easy to put on and take off.
- If you find it hard to sleep, make sure your bedroom is quiet and not too hot or cold.
- Do some gentle exercise each day. Ask your doctor or nurse for advice.
- Go to bed each night at the same time. Each morning get up at same time and do not lie in.
- Use relaxation techniques to get to sleep. For example, gentle exercise, relaxation tapes, etc.
- Avoid stimulants before bedtime, such as alcohol, coffee, tea, coke or chocolate.
Research – what is a clinical trial?

Research into new ways of treating ovarian cancer goes on all the time. By using new drugs or new combinations of drugs and treatments that are already in use, doctors can find new and better ways of treating cancer. Many patients with cancer take part in research studies today. Even though the word ‘research’ or ‘new drug’ sometimes scares people, there is no need for fear. Before a drug or treatment is used on patients, it goes through many stages to make sure it is safe to use.

Phases of research

There are many stages or phases when research is done. If a drug or treatment looks as if might be useful in treating cancer, it is given to patients in research studies called clinical trials. These aim to find a safe dose, see what side-effects may occur and see which cancers can be treated.

If early studies suggest that a new drug may be both safe and effective, further trials are carried out. These aim to:

- Find out if the treatment is better than ones already in use.
- Find out if there are more benefits when the new treatment is given together with current ones.
- Compare the new treatment with current best standard treatments.

Taking part in clinical trials

Your doctor may ask you to try a new treatment. There are many benefits in doing this. You will be helping to improve knowledge about cancer and the development of new treatments. You will also be carefully monitored during and after the study.

You cannot be included in a clinical trial without your permission. You can only give this consent if the trial has been fully explained to you, so that you understand what it is about. This is called informed consent. You will also need time to think about it and discuss it with your family or friends. If you decide not to take part, you will still be given the best proven treatment available. Even after agreeing to take part in a trial, you can still withdraw at any time if you change your mind. As part of research into the causes of cancer, your doctors may ask your permission to store some samples of your cancer cells or blood.

For more information, call the National Cancer Helpline 1800 200 700 or visit our website: www.cancer.ie

Cancer and complementary therapies

There is great interest today in complementary treatments for cancer. Many people find them very helpful during their illness. The way cancer is treated often depends on the culture of the country you live in. In Ireland cancer treatments are based on scientific research, which allows the response to treatment, side-effects and the general effect of treatment to be predicted.

You may hear about the following types of treatments or therapies.

Conventional therapies

Conventional therapies are treatments which doctors use most often to treat people with cancer. These include surgery, radiotherapy, chemotherapy, biological therapies and hormone treatments. They are tried and trusted methods where there is a long history of use. Many of the treatments have been tested in clinical trials.

Complementary therapies

Complementary therapies are treatments that are sometimes given together with conventional treatment. They include therapies such as:

- Meditation
- Relaxation
- Visualisation
- Gentle massage
- Aromatherapy
- Reflexology
- Music, art and dance therapy
- Nutrition therapy
- Shiatsu
- Yoga
- Acupuncture
- Hypnotherapy

Many people find complementary therapies helpful in a number of ways. You may feel more positive about yourself and your illness. You may be better able to cope with the physical side-effects of cancer and the distressing emotions that it can often bring. Some complementary therapies also focus on the spiritual dimension of a person to aid healing.
Understanding cancer of the ovary

Coping and emotions

How can I cope with my feelings?

There are many reactions when told you have cancer. Reactions can differ from person to person. In fact, there is no right or wrong way to feel. There is also no set time to have one particular emotion or not. Some reactions may occur at the time of diagnosis, while others might appear or reappear later during your treatment. Or indeed it may not be until you recover from your illness that your emotions hit hard.

Common reactions include:

- Shock and disbelief
- Fear and uncertainty
- Loss of control
- Sorrow and sadness
- Denial
- Anger
- Resentment
- Blame and guilt
- Withdrawal and isolation

Sometimes a cancer diagnosis can bring greater distress and cause anxiety and depression. A helpful booklet called *Understanding the Emotional Effects of Cancer* is available from the Irish Cancer Society. Call the National Cancer Helpline 1800 200 700 for a free copy.

Shock and disbelief

Shock is often the first reaction to a cancer diagnosis. In fact, you may feel numb and the situation may seem unreal. Many people think cancer will never happen to them and are totally shocked when it does. Even if your doctor and nurse discuss your cancer with you, the news may not sink in for a while. You may find yourself confused, asking the same questions over and over again. Or else you may accept the news calmly and say nothing because you cannot really believe what is happening to you.

If you decide to have complementary or alternative treatments...

Before you decide to change your treatment or add any methods of your own, be sure to talk to your doctor or nurse. Some methods can be safely used along with standard medical treatment. But others can interfere with standard treatment or cause serious side-effects. For that reason, it is important to talk openly with your GP or cancer specialist if you are thinking of having treatment with either a complementary or alternative practitioner. Don’t be afraid that your doctor will be offended by your wish for other treatments. In fact, he or she may be able to recommend therapies that could be safe and useful for you.

Be cautious in selecting a practitioner. Don’t be misled by promises of cures. At present in Ireland, this area is not fully regulated. Ensure that the practitioners you plan to visit are properly qualified and have a good reputation. Check to see if they belong to a professional body or not. If you are unsure but would like to know what other patients have found helpful, contact your doctor or a patient support group. Also, it is important to make sure that the practitioner is charging a fair price for your treatment.

More information is available in a free booklet from the Irish Cancer Society called *Understanding Cancer and Complementary Therapies. A Guide for Cancer Patients*. If you would like a copy or more advice, call the National Cancer Helpline 1800 200 700.

Alternative therapies

Alternative therapies are generally treatments that are used instead of conventional treatments. These therapies include diet therapy, megavitamin therapy and herbalism. The diet therapy can often be restrictive. This means it does not allow you to eat foods that could be nutritious for you. Some restrictive diets can harm your health and may even cause malnutrition. Most doctors do not believe that such treatments can cure or control cancer.

Shock and disbelief

‘It can’t be me.’ ‘Has there been a mistake?’ ‘Cancer happens to other people, not me.’

Shock is often the first reaction to a cancer diagnosis. In fact, you may feel numb and the situation may seem unreal. Many people think cancer will never happen to them and are totally shocked when it does. Even if your doctor and nurse discuss your cancer with you, the news may not sink in for a while. You may find yourself confused, asking the same questions over and over again. Or else you may accept the news calmly and say nothing because you cannot really believe what is happening to you.
Understanding cancer of the ovary

Fear and uncertainty

There is no doubt that cancer is a scary word. Not surprisingly, you may have many fears when first told of your diagnosis. Often the first thing people think about is dying. They think the worst. But nowadays many cancers can be cured or controlled with modern treatments.

Another great fear about cancer is pain. The fear of pain can sometimes overwhelm everything else. However, some cancers cause no physical pain at all or else can be controlled with good painkillers. You may also have fears that your experience of cancer will change who you are and that people with reject or avoid you. For example, after some cancer treatments your body image may be different, and it will take some time for you and for others to adjust to your new look.

You may also have practical worries and fears about the effect of your illness on your family, your finances, your job, and your lifestyle.

It is natural for you to be afraid or concerned about the future too. You may wonder if you will be cured or if your cancer will recur. Living with this uncertainty can make you feel anxious and fearful. You may not wish to make any plans or decisions. Do discuss your concerns with your doctor, nurse or medical social worker, as they can advise and help you. If living with uncertainty overwhelms you, it may help to talk to someone in a support group.

Loss of control

After a cancer diagnosis, it is common for people to feel their life is beyond their control. All your plans may be put on hold. You may even lose some independence and freedom. Because you don’t know enough about your illness at first, you may rely totally on the advice of your doctors and nurses. You may not feel confident making any decisions about your treatment. When you experience a loss of control it can lead to feelings of helplessness. You may also feel that you will be unable to cope with your treatment or that you will ‘fall to pieces’ or ‘go crazy’. You may even lose hope. It takes a while to know what is within your control and what is beyond it. Finding out as much as possible about your illness can help you regain some control. Taking an active part in making decisions about your treatment can help you feel more in control of your illness too.

Sorrow and sadness

It is natural to feel sad when told you have cancer. You may feel sad for a variety of reasons: for the loss of your good health, for the plans that are put on hold, for the people you feel you’ve let down, and for any changes to your body due to treatment. Depending on your type of cancer, your fertility or body image may be affected by treatment. In this case the sadness or sorrow can come from feeling as if a part of you has died. These feelings may not be there all the time and may come and go, but will gradually fade.

Denial

Sometimes after being told their diagnosis, people deny they have cancer. While this may seem unusual, it is a valid way of coping. As a result, you may not wish to mention or discuss your illness. Or else you may talk as if your illness is nothing serious. Denial may last for a short or long time, depending on how long it takes for you to adjust to your illness. Tell your family and close friends that you would prefer not to talk about your illness, at least for the time being. Your doctors and nurses will also understand if you don’t want to hear any information about your cancer until you’re ready.

Anger

It is normal too to be very upset when told you have cancer. Many aspects of your illness can result in anger and distress. Anger can often hide other feelings such as fear, sadness or frustration. You may feel angry towards the doctors and nurses who are caring for you. Or if you have a religious belief, you may feel angry with God for allowing
cancer to occur. You may vent your anger on those closest to you. Indeed being unable to protect the ones you love may frustrate you a lot. Your family and friends may not always be aware that your anger is really at your illness and not at them. It may be helpful to talk to them when you are calm, rather than feeling guilty or trying to bottle up your angry thoughts. Anger can sometimes affect your ability to think clearly. So if it persists and you are finding it hard to talk to your family, tell your nurse or doctor.

Resentment

It is natural that you might be resentful and unhappy because you have cancer, while other people are well. During the course of your illness similar feelings of resentment may occur for many reasons. You may resent that another patient receiving the same treatment as you has responded quicker than you have. You may resent having to change your lifestyle in some way. Sometimes relatives, especially adolescents, can resent the changes that your illness makes to their lives. It is best to admit that these feelings of resentment exist and to express them. Bottling up resentment helps no one. Instead everyone ends up feeling angry and guilty.

Blame and guilt

When diagnosed with a serious illness such as cancer, it is natural to want to know what caused it. Sometimes people blame themselves or others for their illness. As cancer experts rarely know exactly what has caused cancer, there is no good in blaming yourself. Other times, people feel guilty because they delayed going to the doctor with their symptoms, fearing the worst. No matter what the reason, don’t torture yourself at this time.

Don’t feel guilty if you can’t keep a positive attitude, especially when you feel unwell. Low periods are to be expected. There is no evidence that your attitude will affect your health or cancer. Regret and guilt serve no useful purpose. Instead focus on what you can change or do to make you feel more in control of your illness.

Withdrawal and isolation

There is no doubt that a cancer diagnosis is stressful. It can leave you feeling confused and overwhelmed with so much information to take in. At times during your illness you may want to be left alone and withdraw from people. It is normal for you to want to be alone to sort out your thoughts and feelings. You will want to take stock of things and work out how best you can cope. However, it is not a good idea to spend long hours on your own every day. Sometimes depression can make you avoid family and friends and stop you wanting to talk. If you isolate yourself, it can be hard for your family and friends, as they will want to share this difficult time with you. They may worry about you needlessly. Let your family and friends know that you will talk to them once you are ready.

If you would like more information on how to talk about your cancer, there is a useful booklet available called *Who Can Ever Understand? – Talking about Your Cancer*. If you would like a copy, call the National Cancer Helpline 1800 200 700.

Learning to cope

After any treatment for cancer it can take some time to come to terms with your emotions. Coping with the physical effects of treatment can also add to the burden of dealing with cancer.

While it is true that some treatments can have some unpleasant side-effects, many people are able to live a normal life during treatment. You will need to take some time off for your treatment as well as time afterwards to recover. Just do as much as you feel like and take plenty of rest. It is not a sign of failure to ask for help or to feel unable to cope on your own. Once other people understand how you are feeling, they too can give you more support.
Positive emotions
A cancer experience can also bring positive emotions. You may experience great love, affection and closeness by those around you, not only family and friends but also neighbours and the healthcare team. With that can come a sense of gratitude too. The experience of cancer can also bring personal growth and knowledge – it can make you realise where your strength lies and what is important in life for you. You may also get the chance to do and enjoy different things that you would never have done otherwise.

How can my family and friends help?
Your family and friends can support you through your cancer journey in different ways. Some family members and friends can offer a listening ear and give you advice if needed. Some may gather up-to-date information on cancer to know what you can expect and what you are going through. Others may prefer to help you in a practical way with travelling to and from the hospital, with childcare, cooking, shopping or housework. It may take time to know which way suits you and your family or friend best.

How to talk to someone with cancer
When someone close to you has cancer it can be hard to know what to do. Their welfare may be a priority for you, but still you might be unsure when to visit or what to talk about. You may be afraid of upsetting them or saying the wrong thing. So it may seem best to pretend that everything is okay and carry on as normal. Sadly, by not talking to your friend or loved one, it can make them feel even more lonely and isolated. Try not to withdraw because you’re afraid of their illness or what might happen in the future. Although some people do die from cancer, many do not. Be honest with your feelings too.

Often those with cancer do not wish to burden their family and friends with their worries and concerns. Gentle encouragement can sometimes help. But don’t rush into talking about their illness – knowing that you are always ready to listen and give help may reassure them. You may think you are not doing much by just listening. In fact, it is one of the best ways to help.

Be patient
Sometimes your friend or relative may get cross or irritable for what may seem to be no good reason. These feelings are completely normal. Be as patient and understanding as you can. Give them the space and time to adjust to the changes in their life. Above all, let them know that you are there, if they want to talk or need help. In time, life will begin to be normal again.

Lost for Words: How to Talk to Someone with Cancer is a useful booklet written for relatives and friends of people with cancer. Call the National Cancer Helpline 1800 200 700 for a free copy.
How can I talk to my children?

A cancer diagnosis can affect an entire family. It can bring changes that may be either great or small. Even so, it is best to keep family life as normal as possible. Continue with school and other activities, with birthdays and celebrations or work commitments. It may take a while but families can learn to adjust to big changes in their lives.

Every family deals with cancer in its own way. You may feel that you do not want your illness to upset family life, or feel guilty that you cannot do activities with your children or that you’re letting them down. These are all natural feelings to have at this time.

Be honest

The main thing to remember is that being honest with your family really helps. Keeping your illness a secret may not be the best thing for your children. It can put added pressures on your family and lead to confusion. Children are very sensitive to stress and tension and if you try to protect them by saying nothing, they may feel isolated. In fact, they may have greater fears if told nothing.

It is best that you or your partner tell your children about your cancer diagnosis. If this is not possible, then someone else close to your children should break the news.

How much you tell children will depend on their age and level of maturity. Very young children do not understand illness and need a simple reason why their parent or friend is sick and has to go to hospital regularly. A story about good cells and bad cells usually works well. Most children over 10 years of age can take in fairly full explanations of why you are sick. Adolescents can understand far more.

It is best to prepare children for what to expect from the side-effects of treatments before they happen and to answer their questions simply and honestly. For example, if you get hair loss due to treatment. It is also important not to force your children to talk about your illness. If they rebel or turn quiet, it may be their way of showing their feelings.

Coping with children’s emotions

During your illness, your children may experience a range of emotions from fear, guilt and anger to neglect, loneliness, isolation and embarrassment. They need to be reassured that your illness is not their fault. Whether they show it or not, children may feel that they somehow are to blame. Also, by having an open honest approach, it may bring you a sense of relief too. Your family may also find new depths of love and inner strength that will boost your life together.

If you need some extra help in dealing with children, talk to your nurse or medical social worker. A useful booklet called *Talking to Children about Cancer. A Guide for a Parent with Cancer* gives practical advice for talking to children about cancer. If you would like a copy, call the National Cancer Helpline 1800 200 700.

What else can I do?

Everyone experiences cancer in a different way. And how each person copes with cancer varies too. There is no right or wrong way to cope, only your way. During your illness there are many things that you can learn, not only about cancer itself but also about you as a person. Here is a list of things to help make you feel more involved and more in control of your illness. They can help to boost your self-esteem and well-being, making it easier to deal with cancer.

- **Communicate with your family and close friends:** Do not keep your worries or symptoms secret from the people closest to you. This includes physical or emotional problems. Ask the person closest to you to come with you when visiting the doctor and when treatments will be discussed.

- **Live one day at a time:** Don’t think about the future too much. Concentrate on the present and getting through each day of tests or treatment. That way, you may find it easier to cope with your illness.

- **Live well:** Try to eat as well as you can. Eat little and often including lots of different types of foods with plenty of fresh fruit.
and vegetables. Do some regular exercise that you enjoy. Take it easy at first, building up the amount you do, as you feel stronger.

- **Expect change in your life**: Even though you may want to stick to your old routines, sometimes this may not be possible. It may take a while to adjust to your new routine but keep an open mind. Change may bring new opportunities and blessings.

- **Keep an open mind**: Don’t feel you have to be positive all the time. Expect ups and downs during your cancer journey. There will be times when you feel low but don’t feel guilty about it, as it will pass.

- **Seek information**: Be sure to ask your doctor as many questions as you can and get involved in decisions about your treatment. Always ask for information that is personal to you. Ask what side-effects you can expect so you can prepare yourself for them. Build up as much information about your cancer and treatment as possible. Follow your doctor’s instructions carefully. Take your medication. If you forget and are not sure what to do, ask your doctor. Keep a notebook of all your dates for blood tests, X-rays, scans, treatments, symptoms, side-effects, medications, and your general health. Keep a record of any emotions you are feeling too, especially strong ones. Call 1800 200 700 for a free copy of *Journey Journal* to help you keep track of your cancer treatment.

- **Find what works for you**: It can help to use whatever way of coping that has helped you solve problems in the past. Some people are comfortable talking about their illness, others are not. You may prefer relaxation, meditation, walking, listening to music, or other approaches helpful. Do whatever suits you. But if it’s not working, be open to finding a new way to cope.

- **Build a support network**: Be realistic about what you can manage by yourself. No man is an island, so seek help from those who want to support you. Talk to your family, friends, nurses or doctors. Meet with other patients in support groups and self-help groups as they can understand what you are going through. If the group does not suit you and is not helping, leave it.

- **Seek professional help**: If you have any low moods or strong emotions talk to your close friends and family – or someone who is a good listener. If they are still getting the better of you, discuss them with your nurse and doctor. They may recommend you talk to a trained counsellor or other specialist.

- **Spiritual care**: When faced with a cancer diagnosis and treatment, you may start thinking about the meaning of life and the afterlife. For some people spiritual and religious beliefs can bring comfort and hope. Prayer or meditation can help you to focus on what has value and meaning in your life. Even if you do not consider yourself a religious or spiritual person, it is still possible to take comfort and support from these practices. Some complementary therapies that have a spiritual dimension may also help you to focus on being positive and hopeful.

- **Express yourself**: Keep a diary or journal if you need to express yourself without holding back. It can help you to make sense of your cancer journey and can bring great healing and relief. Other forms of creative expression, such as music and art, may help too.

A useful booklet called *Understanding the Emotional Effects of Cancer* has been written for people with cancer and is available from the Irish Cancer Society. Call the National Cancer Helpline 1800 200 700 if you would like a free copy.

Don’t feel you have to be positive all the time. Expect ups and downs during your cancer journey.
Support resources

Who else can help?

There are many people ready to help you and your family throughout treatment and afterwards.

- Medical social worker
- Cancer nurse specialists
- Psycho-oncology services
- Family doctor (GP)
- Community welfare officer and community health services
- Support groups and cancer support centres
- Irish Cancer Society helpline nurses

Medical social worker: The medical social worker in your hospital can help in many ways. He or she can give support and counselling to you and your family and give advice on benefits, entitlements and services available when you go home.

Cancer nurse specialists: Some of the major cancer treatment hospitals have oncology liaison nurses and/or cancer nurse co-ordinators. These specially trained nurses can support you and your family from the time of diagnosis and throughout treatment. These nurses along with other members of your medical team work together to meet your needs.

Psycho-oncology services: In some larger hospitals there are special units that provide psycho-oncology services. This means that you can receive psychological care and support during your diagnosis, treatment and recovery by a team of experts. Usually the team consists of psychiatrists, clinical psychologists and nurses working closely together.

GP (family doctor): You may feel comfortable talking to your family doctor (GP) about your cancer too. He or she can discuss any of your queries and offer advice and support.
Community health services: When you go home, there are various community health services available from your local health centre. These centres have public health nurses (who can visit you at home), welfare officers and home-help organisers. If you live far from your hospital, your community welfare officer can also help with practical issues such as transport costs, financial worries, etc. All these people in community health services can provide advice and support. More information on the services is available either from the social worker in the hospital before you go home or at your local health centre.

Support groups: Joining a support group can put you in touch with people who have been in a similar situation. They can give you practical advice about living with ovarian cancer. Cancer support centres and groups are found in most counties in Ireland and can offer a wide range of services. Some are listed at the back of this booklet.

Irish Cancer Society: The staff of the National Cancer Helpline will be happy to discuss any concerns you or your family may have, at any stage of your illness. This can range from treatment information or practical advice about your financial matters. For example, getting a mortgage or travel insurance. Call 1800 200 700 for information about any of the services outlined above or for support services in your area.

Health care services

Health cover

At the end of this section there are also some useful telephone numbers and addresses for further help.

Hospital cover

At present, everyone is entitled to hospital inpatient services in a public ward in all public hospitals. There is a €75 a night charge up to a limit of €750 in 1 year. These charges do not apply to medical card holders. Higher rates apply for semi-private or private care.

Outpatient cover

If you go to the outpatients or A&E unit of a public hospital, without being referred there by a GP, you may be charged €100. There is no charge if you have a medical card or are admitted to hospital because of attending the A&E unit first.

Medical card

A medical card usually allows you, your spouse and any child under 16 to free GP services, prescribed drugs and medicines, inpatient public hospital services as well as outpatient services and medical appliances. You may have to pay a prescription charge of 50c per item up to a limit of €10 per family.

To qualify for a medical card depends on a means test. If you are over 70 and your weekly income is €700 or less, you can still apply for a card. Financial guidelines are set out each year and are available from your local Health Service Executive (HSE) office. If your means are above but close to the guidelines, you should apply for a card anyway as a card may be granted in some situations. For example, if you have a large amount of medical expenses. Also, you may qualify for a medical card because you have a cancer diagnosis. In this case, your spouse and children will not be covered if your means are over the limit.

GP visit card

If you do not qualify for a full medical card, you may be eligible for a GP visit card. This card covers visits to your doctor only and you will have to pay for drugs, outpatient/inpatient charges and medical
appliances yourself. It is means tested but will take into account your after-tax income and certain expenses like childcare, rent/mortgage and travel to work. Check with the medical social worker at the hospital or your HSE office to see if you are eligible.

**Drugs Payment Scheme**
Under the Drugs Payment Scheme (DPS), individuals and families, including spouses and dependent children, pay a limit of €120 each month to cover the cost of prescribed drugs, medicines and appliances. You can apply for cover under the scheme by contacting your local HSE office. You can also register for this scheme by filling in a registration form at your local pharmacy.

**Private healthcare cover**
Private health insurance pays for private care in hospital or from various specialists in hospitals or in their practices. In Ireland, this is available through the VHI, Quinn Healthcare, AVIVA Health and other schemes. They provide cover for day care/inpatient treatment and hospital outpatient treatment. Before attending hospital, do check the level of cover provided by your insurer, both for inpatient and outpatient services.

If you have private insurance, your tests might not get done as quickly as you would like. Your health insurer has to approve some tests in advance, e.g. MRI scan, PET scan. It might take 24–48 hours to get approval from your health insurer sometimes.

**Benefits and allowances**
Information on the following is given in this section:

- Illness Benefit
- Disability Allowance
- Invalidity Pension
- Carer’s Benefit
- Carer’s Leave
- Appliances
- Travel to hospital
- Travel to hospital

**Illness Benefit**
This is a benefit for insured people. Your eligibility will depend on your PRSI contributions. You must be under 66 and unable to work due to illness. Each week you must send a social welfare medical certificate signed by your doctor to the Dept of Social Protection, PO Box 1650, Dublin 1. Tel (01) 679 7777. These certificates are available from your GP and from the hospital you attend during inpatient care. You should send your claim to the Department within 7 days of becoming ill and unable to attend work. A delay might result in loss of payment. The benefit lasts for 2 years.

**Disability Allowance**
You might qualify for disability allowance if you are not eligible for illness benefit and not able to work for at least 1 year. Disability allowance is a weekly allowance paid to people with an injury, disease or a disability who are aged between 16 and 66. For this allowance, you must satisfy a means test, live in Ireland and be medically suitable. To be medically suitable, you should have an illness that has continued or may continue for at least 1 year.

You are also allowed a free travel pass and will get extra social welfare benefits, like the household benefits package. This includes allowances for gas, electricity, telephone rental and a free television licence. You are also entitled to a medical card and assistance under the Supplementary Welfare Allowance Scheme. Application forms are available from post offices, social welfare offices or the Disability Allowance Section, Social Welfare Services Office, Government Buildings, Ballinalee Road, Longford. Tel: (043) 334 0000 or Localcall 1890 927 770.

**Invalidity Pension**
This is a pension paid instead of an illness benefit or disability allowance, if you are unable to work permanently. There are three cases where you can be eligible. (1) If you have been incapable of work for at least 12 months and likely to be incapable for at least another 12 months. (2) If you are permanently incapable of work. (3) If you are over the age of 60 and have a serious illness or incapacity.
Your eligibility will also depend on your PRSI contributions. You are also allowed a free travel pass and will get extra social welfare benefits, like the household benefits package. This includes allowances for gas, electricity, telephone rental and a free television licence. You are also entitled to a medical card and assistance under the Supplementary Welfare Allowance Scheme. Application forms are available from the Invalidity Pension Claims Section, Social Welfare Services Office, Government Buildings, Ballinalee Road, Longford. Tel: (043) 334 0000 or Local 1890 927 770.

Carer’s Allowance
This is an allowance for carers on low incomes who look after someone who needs full-time care and attention. You must be aged 18 or over, live in Ireland, satisfy a means test, not be self-employed or work more than 15 hours a week outside the home, and not live in a hospital or nursing home. You are also allowed a free travel pass and will get extra social welfare benefits, like the household benefits package. This includes allowances for gas, electricity, telephone rental and a free television licence. You are also entitled to a respite care payment every year. For more advice, talk to your social worker and/or the Dept of Social Protection.

Application forms are available from your social welfare office or from the Carer’s Allowance Section, Social Welfare Services Office, Government Buildings, Ballinalee Road, Longford. Tel: (043) 334 0000 or Local 1890 927 770.

Carer’s Benefit
If you are employed but wish to care for a sick relative full time, you might qualify for a carer’s benefit. This is a payment made to insured persons who leave the workforce to care for someone in need of full-time care and attention. You must be employed for 8 weeks in the 26-week period immediately before applying for the benefit. You must be aged 16 or over, live in Ireland, not be self-employed or employed while caring for the person, and not live in a hospital or nursing home. More information is available from the Carer’s Benefit Section, Social Welfare Services Office, Government Buildings, Ballinalee Road, Longford. Tel: (043) 334 0000 or Local 1890 927 770.

Carer’s Leave
By law you may be entitled to unpaid temporary leave from your employment. Carer’s leave allows you to leave your employment for up to 104 weeks to care for someone in need of full-time care and attention. The leave will be unpaid, but you will have your job kept open for you while you are on leave. You do not need to be eligible for carer’s allowance or carer’s benefit to apply for carer’s leave. You must have worked for your employer for a continuous period of 12 months to be eligible to apply for carer’s leave. The person you are caring for can be a partner or family member, friend or colleague. The family doctor (GP) of the person you are caring for will also need to fill in part of your application form.

You can work while you are on carer’s leave for up to 15 hours a week. But you must make sure your income from employment or self-employment is less than a weekly income limit set by the Department of Social Protection. For more information, contact the Carer’s Benefit Section, Social Welfare Services Office, Government Buildings, Ballinalee Road, Longford. Tel: (043) 334 0000 or Local 1890 927 770.

Appliances
For patients who have medical cards most appliances are free of charge. For example, colostomy bags. If you receive chemotherapy and suffer from hair loss, you are entitled to 1–2 free or subsidised wigs or hairpieces every year.

Travel to hospital
Patients can be faced with many expenses including travelling to and from hospital. If your travel costs are very expensive, discuss it with your social worker at the hospital. Limited help may also be available from your community welfare officer. Some HSE areas provide transport services to hospitals for outpatient appointments and day centres. Sometimes the HSE may assist with transport costs for a person who has to travel a long distance to a hospital.

In general, those who do not have a medical card may be charged for the service. However, the practice varies between HSE areas and often depends on personal circumstances. Charges may be waived in certain cases, like hardship. See page 67 for information on the Care to Drive and Travel2Care schemes run by the Irish Cancer Society.
Further information

Depending on your circumstances at the time of your illness, there are many other benefits and entitlements that may be relevant to you. Always have your PPS number (old RSI number) to hand when you are enquiring about entitlements and benefits. The most direct way to check your eligibility is to contact:

- Your community welfare officer in your local health centre
- The medical social worker in the hospital you are attending

For social welfare queries, contact:

Dept of Social Protection – Tel: 1850 662 244

Information is also available from your local Citizens Advice Centre. A list of these centres is available from:

Citizens Information Board (formerly Comhairle)
Ground Floor, George’s Quay House, 43 Townsend Street, Dublin 2 Tel: 01 605 9000; Local: 1800 777 121 Email: info@ciboard.ie; Website: www.citizensinformation.ie

There are also some booklets available that may help you. These include:

- Information Guide to Health Services (published by the Dept of Health). Copies are available from your local HSE area office. Tel: 01 671 4711 for local HSE numbers.
- Guide to Social Welfare Services (published by the Dept of Social Protection). Copies are available from the Dept of Social Protection. Tel: 01 874 8444. Email: info@welfare.ie. Website: www.welfare.ie
- Entitlements for People with Disabilities (published by Comhairle). Copies are available from the Citizens Information Board. Tel: 01 605 9000 / 1890 777 121. Email: info@ciboard.ie Website: www.citizensinformation.ie
If you have financial worries…

A diagnosis of cancer can sometimes bring the added burden of financial worries. You may find that you have a lot more expenses, like medication, travel, food, heating, laundry, clothing and childcare costs. If you are not able to work or unemployed, this may cause even more stress. It may be hard for you to recover from cancer if you are worried about providing for your family and keeping a roof over your head.

There is help available if you find it hard to cope with all these expenses. Contact your medical social worker in the hospital or your local health centre for advice. The Irish Cancer Society can also in certain cases give some assistance towards travel costs and other expenses because of your illness. See page 67 for more details. You can also call the National Cancer Helpline 1800 200 700 for ways to help you manage.

If you feel you are getting into debt or are in debt, there is help available. Contact the Money Advice and Budgeting Service on the MABS Helpline 1890 283 438. This service can help you work through any financial issues you have. They can assess your situation, work out your budget, help you deal with your debts and manage your payments. The service is free and confidential. See page 68 for contact details.

Irish Cancer Society services

The Irish Cancer Society funds a range of cancer support services that give care and support for people with cancer at home and in hospital.

- Cancer Information Service (CIS)
- Daffodil Centres providing cancer information
- Cancer support groups
- Peer-to-peer support
- Counselling
- Night nursing
- Oncology liaison nurses
- Cancer information booklets
- Financial support
- Care to Drive transport project
- Night nursing
- Oncology liaison nurses
- Cancer information booklets
- Financial support
- Care to Drive transport project

Cancer Information Service (CIS)

The Society also provides a Cancer Information Service with a wide range of services. The National Cancer Helpline is a freephone service that gives confidential information, support and guidance to people concerned about cancer. It is staffed by specialist cancer nurses who have access to the most up-to-date facts on cancer-related issues. These include prevention of cancer, risk factors, screening, dealing with a cancer diagnosis, different treatments, counselling and other support services. The helpline can also put you in contact with the various support groups that are available. The helpline 1800 200 700 is open Monday to Thursday from 9am to 7pm, and every Friday from 9am to 5pm.

- All queries or concerns about cancer can be emailed to the CIS at helpline@irishcancer.ie
- The walk-in caller service allows anyone with concerns about cancer to freely visit the Society to discuss them in private.
- Message Board is a message board on our website (www.irishcancer.ie) to share your stories, ideas and advice with others.
- The CancerChat service is a live chatroom with a link to a Cancer Information Service nurse.

Daffodil Centres providing cancer information

Daffodil Centres are located in a number of Irish hospitals. They were set up by the Irish Cancer Society in partnership with each hospital and are an extension of the Cancer Information Service. They are generally found near the main entrance of the hospital and are open during the day. Staffed by a specialist nurse and trained volunteers, they provide a range of information, advice, help and support on all aspects of cancer, free of charge.

Daffodil Centres give enquirers a chance to talk in confidence and be listened to and heard. If you are concerned about cancer, diagnosed with cancer or caring for someone with cancer, you are welcome to visit the centre. Do check to see if there is a Daffodil Centre in your hospital.
Cancer support groups
The Irish Cancer Society funds a range of support groups set up to support you and your family at time of diagnosis, throughout treatment and afterwards. See page 69 for more details.

Peer-to-peer support
Many patients find it helpful to talk to someone who has had a diagnosis of cancer and who has recovered. The Irish Cancer Society can put you in touch with someone who has been trained to give you emotional and practical support. All volunteers have had a personal experience of cancer and understand the emotional and physical impacts of the disease. If you would like to make contact with a volunteer, please call the National Cancer Helpline 1800 200 700.

Counselling
Coping with a diagnosis of cancer can be very stressful at times. Sometimes it can be hard for you and your family to come to terms with your illness. You might also find it difficult to talk to a close friend or relative. In this case, counselling can give you emotional support in a safe and confidential environment. Call the helpline 1800 200 700 to find out about counselling services provided by the Irish Cancer Society and services available in your area.

Night nursing
The Irish Cancer Society can provide a night nurse, free of charge, for up to 70 hours (mainly at night) if you are seriously ill at home. The night nurse can also give support to your family. You can find out more about this service from a member of the homecare team, your GP or local public health nurse. Homecare nurses are specialist palliative care nurses who offer advice on pain control and other symptoms.

Oncology liaison nurses
The Society funds oncology liaison nurses who can give you and your family information as well as emotional and practical support. Oncology liaison nurses work as part of the hospital team in specialist cancer centres.

Cancer information booklets
These booklets provide information on all aspects of cancer and its treatment. They also offer practical advice on learning how to cope with your illness. The booklets are available free of charge from the Irish Cancer Society.

Financial support
A diagnosis of cancer can bring with it the added burden of financial worries. In certain circumstances, the Irish Cancer Society can provide limited financial help to patients in need. You may be suitable for schemes such as Travel2Care or Financial Aid.

The Travel2Care scheme can help with your travel costs if you have genuine financial hardship due to travelling to a designated cancer centre or approved satellite centre. It will help with the costs of public transport, such as trains or buses, private transport costs, or petrol and parking. If you are travelling to a Rapid Access Diagnostic Clinic, you may qualify for the Travel2Care scheme.

Travel2Care: If you would like to request this kind of help, contact your oncology nurse or the Irish Cancer Society.

Financial Aid: For this kind of help, contact the social work department in your hospital. You can also speak to your oncology nurse or contact the Irish Cancer Society.

See our website for more information: www.cancer.ie

Care to Drive transport project
Care to Drive is a scheme operated by the Irish Cancer Society. It provides free transport for patients to and from their treatments using volunteer drivers. All of the volunteers are carefully selected and trained. You, the patient, are collected from your home, driven to your appointment and brought back home again.

If you would like more information on any of the above services, call the National Cancer Helpline 1800 200 700.

Questions to ask your doctor

Here is a list of questions that you might like to ask. Never be shy about asking questions. It is always better to ask than to worry.

- What tests do I need?
- What type of ovarian cancer do I have? Where exactly is it?
- Will you know what treatment I need after you have the test results?
- How long will it take to do all the tests?
- What type of treatment do I need? Why is this one better for me?
- How successful is this treatment for my cancer?
- Are there other treatment options?
- What side-effects or after-effects will I get?
- How long will my treatment take?
- Do I have to stay in hospital for my treatment?
- Is there anything I can do to help myself during treatment?
- Should I eat special foods?
Acknowledgements

We would like to extend a special word of thanks to the following for their invaluable contributions to this booklet and/or previous editions:

Eileen O’Donovan, Cancer Information Nurse
Jo Ballot, Clinical Trials Co-ordinator
Val Connelly, Cancer Nurse Co-ordinator
Elizabeth Doyle, Cancer Nurse Co-ordinator
Anne-Marie Dunne, Information Officer
Michelle Griffin, Clinical Nurse Specialist
Phil Harford, Cancer Nurse Co-ordinator
Selena Igoe, Cancer Nurse Co-ordinator
Debra McKnight, Cancer Nurse Co-ordinator
Elaine Purcell, Medical Social Worker

Would you like to be a patient reviewer?

If you have any suggestions as to how this booklet could be improved, we would be delighted to hear from you. The views of patients, relatives, carers and friends are all welcome. Your comments would help us greatly in the preparation of future information booklets for people with cancer and their carers. Please fill in the postcard in the pocket inside the back cover, and post it back to us for free.

If you wish to email your comments, have an idea for a new booklet or would like to review any of our booklets, please contact us at reviewers@irishcancer.ie

If you would prefer to phone or write to us, see contact details below.

Would you like more information?

We hope this booklet has been of help to you. If you feel you would like more information or someone to talk to, please call the National Cancer Helpline 1800 200 700.

Would you like to help us?

The Irish Cancer Society relies entirely on voluntary contributions from the public to fund its programmes of patient care, education and research. If you would like to support our work in any way – perhaps by making a donation or by organising a local fundraising event – please contact at CallSave 1850 60 60 60 or email fundraising@irishcancer.ie

Irish Cancer Society, 43/45 Northumberland Road, Dublin 4
Tel: 01 231 0500 Email: info@irishcancer.ie Website: www.cancer.ie
The mission of the Irish Cancer Society is to play a vital role in achieving world-class cancer services in Ireland, to ensure fewer people get cancer and those that do have better outcomes. Our goals are focused around prevention, survival and quality of life, with three programme areas to achieve them: advocacy, cancer services and research.
